

Clinical platform walkthrough

Fifteen historical synthetic screenshots with factual annotations, release provenance, and evidence limits.

Purpose

Help a buyer inspect the existing UI and distinguish working code from simulations and unimplemented vendor connections.

Candidate release

v1.1.2-acquisition-accuracy

Source

github.com/alexmarshiamft/clinical_saas_launch

Prepared

October 6, 2026

Screenshots were already in the repository and were not recaptured for this accuracy release. Capture-time deployment and source SHA are not established. Some embedded UI labels contain older marketing claims; corrected captions and scope notes govern the evaluation.

Read the evidence within its scope

Working code

Clinical workspaces, note templates, redaction heuristics, security checks, compensation math, ledger validation, and text/JSON export formatting.

Sandbox behavior

Synthetic patient and financial records, WebRTC loopback, heuristic browser speaker labels, treasury simulation and synthetic claim statuses, and unconfigured subscription checkout.

Vendor work

Remote telehealth, verified speech diarization, clearinghouse transport/remittances, hospital EHR connectivity, live payroll tax filing, and bank settlement remain unverified or unfinished.

Production prerequisites

Verify identity, persistence, durable audit storage, backups, monitoring, and agreements. Move Gemini secrets/calls behind a server boundary; a configured key is embedded by Vite into client assets.

No independent security or HIPAA certification, production readiness for patient PHI, or absolute privacy guarantee is established by these materials. Browser speech recognition may use browser-vendor services.

- Historical images illustrate UI, not current deployment state or vendor connectivity.
- Synthetic fixtures do not prevent a user from entering real data; evaluate only with synthetic inputs.
- Practice OS finance modules are documented in the handoff and deck; the 15 screenshots focus on earlier clinical workspaces.

Landing page and public showcase

/

Historical synthetic UI

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Public entry point, clinical-tool previews, and evaluator demo launch. This image preserves historical presentation, including older privacy and compliance wording. It does not verify current deployment, vendor contracts, or absence of PHI from user-supplied data.

- Demo launch and navigation UI
- Four clinical tool previews
- Use synthetic input for evaluation

Source: src/pages/Landing.tsx; src/components/demo/DemoGuideModal.tsx

Demo guide and feature catalog

/ (Demo Guide)

Historical synthetic UI

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Guide modal with clinical journey, feature directory, subscription sandbox, and redaction-category reference. Its feature descriptions are not independent verification. Speaker diarization, connected EHR export, and compliance badges require the limits described in this document.

- | Guided clinical journey
- | Feature and subscription previews
- | Reference grid for identifier categories

Source: src/components/demo/DemoGuideModal.tsx

Clinician dashboard

/dashboard

Implemented UI / synthetic records

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Navigation hub with appointments, tool launch tiles, encounter context, and practice profile controls. Displayed counts and patient details are fixture data. The screenshot is not evidence of a connected clinical practice or production multi-site deployment.

- Synthetic encounter context
- EHR, Scribe, Aura, and Scrubber navigation
- Appointment and practice controls

Source: src/pages/DashboardHome.tsx; src/components/layout/Header.tsx

EHR client roster

/dashboard/ehr

Implemented UI / synthetic records

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Client directory with filtering, diagnostic and procedure labels, session counts, and intake status. These controls are implemented for evaluation. Persistence, permissions, and clinical workflows must be verified in a buyer-configured deployment.

- Client search and filtering
- Chart and encounter navigation
- Fixture diagnosis and procedure labels

Source: src/tools/theraflow/ClientsView.tsx; src/tools/theraflow/EhrWorkspace.tsx

Client chart and progress notes

/dashboard/ehr (client detail)

Implemented UI / synthetic records

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Synthetic client chart showing demographics, diagnostic labels, and DAP notes. Source code includes note-author and signed-note controls; the image alone cannot establish persistence, audit coverage, or clinical record compliance.

- DAP documentation UI
- Clinical-tool handoff controls
- Historical encounter fixture data

Source: src/tools/theraflow/ClientProfileView.tsx; supabase/migrations/

`/dashboard/calendar`

Implemented UI / synthetic records

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

Day, week, and month scheduling views with appointment chips and room-launch shortcuts. Telehealth badges route to the evaluation room; they do not establish a working remote consultation with a second participant.

Calendar view controls

Appointment and clinician labels

Evaluation-room launch shortcuts

Synthetic evaluation | Historical images, corrected annotations

Telehealth evaluation room

/dashboard/telehealth

Loopback simulation

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Local camera/microphone controls, session timer, and notepad around a WebRTC loopback demonstration. The meeting API returns simulated metadata. This is not a verified remote video-consultation service, executed BAA, or independently certified HIPAA deployment.

Local media or synthetic fallback	Camera/microphone toggles and timer	Remote signaling and relay integration unfinished
-----------------------------------	-------------------------------------	---

Source: src/tools/theraflow/webrtc-provider.ts; src/tools/theraflow/TelehealthView.tsx; server.ts

[/dashboard/billing](#)

Implemented UI / simulated statuses

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

Encounter ledger, amounts, payer labels, and claim states shown with synthetic records. There is no implemented 837P generator or clearinghouse transport in the reviewed source. The displayed statuses are not live payer acknowledgments or settlement evidence.

Claim transmission remains integration work

Synthetic evaluation | Historical images, corrected annotations

Superbill reimbursement modal

/dashboard/billing (claim modal)

Implemented form / synthetic input

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Reimbursement-statement modal and text export using fixture demographics, ICD-10/CPT labels, and provider information. The source implements a superbill statement, not a verified official 33-box CMS-1500 form editor. No payer acceptance or clinical coding correctness is established.

- Superbill preview and reimbursement text
- Charge and provider information fields
- Validate format with target counterparties

Source: src/tools/theraflow/SuperbillModal.tsx

Implemented logging / deployment limits

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

Event viewer and export controls. The server implements HMAC-signed, hash-chained audit records and tenant filtering. These are tamper-evidence mechanisms; the screenshot does not prove universal event coverage, immutable infrastructure, retention controls, or HIPAA compliance.

- Source: src/tools/theraflow/AuditLogsView.tsx; src/lib/audit.ts; server.ts

Scribe transcript and note workspace

/dashboard/scribe

Synthetic / browser speech path

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Transcript feed, audio visualization, speaker labels, and note-generation controls. Browser recognition labels speakers by conversational heuristics; synthetic fixtures also demonstrate the UI. Acoustic speaker identification and cloud-provider accuracy have not been established.

Synthetic utterance feed	Browser SpeechRecognition when supported	Recognition privacy depends on the browser vendor
--------------------------	--	---

Source: src/tools/scribe/ScribeWorkspace.tsx; src/tools/scribe/audio-transcription-provider.ts

Scribe templates and export formatters

/dashboard/scribe (template studio)

Implemented templates / file export

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Documentation templates, prompt customization, and export-format controls. Epic SmartText, Cerner text, and FHIR-shaped JSON are generated for download or clipboard. They are not authenticated writebacks to hospital EHR systems and are not verified interoperability.

- SOAP, intake, DAP, and referral templates
- Note-density and prompt controls
- EHR output formatting for review

Source: src/tools/scribe/NoteTemplates.tsx; src/tools/scribe/MultiEhrExportPanel.tsx; src/tools/scribe/utls/ehrExportAdapters.ts

Aura note-assistance interface

/dashboard/aura

Implemented assistance / clinician review

Historical synthetic screenshot; not recaptured. Embedded UI claims may be outdated.

IMPLEMENTED BEHAVIOR AND LIMITS

Searchable diagnostic examples, criteria controls, typewriter note display, and floating assistant UI. The bundled reference is limited and is not a comprehensive DSM database. Suggested documentation is assistance and requires qualified clinician review.

- Bundled diagnostic reference examples
- Criteria and note-assistance UI
- Clinical validity is not established by UI tests

Source: src/tools/aura/AuraStudio.tsx; src/tools/aura/data/dsm5-database.ts

Implemented heuristics / known misses

LEGAL NOTICE & SYNTHETIC DATA DISCLAIMER:

All patient records, clinical notes, audio transcripts, MRNs, and names in this demonstration are 100% fictional, synthetic, and computer-generated. None of the data is real, and NO actual Protected Health Information (PHI) is present or processed. Any resemblance to real persons is purely coincidental.

IMPLEMENTED BEHAVIOR AND LIMITS

Browser redaction UI with 18 identifier-category rule definitions, diff view, masking styles, and category reports. Category coverage does not establish removal of every identifier. Historical holdout results include missed entities; human review remains necessary.

No guarantee of complete de-identification

Test and database evidence

Immutable baseline CI

Runs 37514914857 (master) and 37514932475 (remediation-pass-2) passed on snapshot 515cefe320b46b9e50695849dd23ce0c2b93cd63.

Client security	26 / 26
Server security / tenant isolation	29 / 29
Empirical server stress	28 / 28
EHR	30 / 30
Scribe	61 / 61
Aura / PHI scrubber	85 / 85
Financial / security invariants	Passing; inspect logs

Those historical CI runs did not execute the migration pipeline. Published v1.1.1 runs 37519919273 and 37519932172 include the original migration harness at fd9e2b3e442016f4dc9e85b893bb092b68393a97. The v1.1.2 candidate strengthens database assertions and requires its own matching branch/PR CI evidence.

Database counting methodology

Two migration files define 31 unique public tables plus the auth.users standalone-PostgreSQL compatibility shim: 32 total CREATE TABLE targets. They contain 59 CREATE POLICY statements; one policy is dropped, leaving 58 active policies after both migrations are applied. Verify installed assets through pg_tables and pg_policies in a disposable database.

```

RESOLVE CANDIDATE COMMIT AFTER PUBLICATION

```
git rev-parse v1.1.2-acquisition-accuracy^{commit}
```

The baseline annotated tag is unsigned. v1.1.2-acquisition-accuracy is a candidate. Tag resolution succeeds only after publication. Matching branch/PR CI evidence must identify the tested candidate SHA; the PDF avoids embedding its own enclosing commit SHA.

Redaction is assistive

The earlier recorded holdout evaluated 610 synthetic snippets / 3,410 entities: 81.64% recall with 626 missed entities. The fresh report evaluated 250 snippets / 1,540 entities: 92.79% recall with 111 missed entities. These distinct historical synthetic overlap-based evaluations are not real-world recall estimates; precision counts are not reconciled here.

The Scribe and DAP outbound LLM paths call a sanitization gateway that aborts on engine errors or known context name/MRN leftovers. It cannot reject identifiers it fails to detect. Clinician review and deployment privacy safeguards remain required.
